Automating Business Processes Using Deluge Scripting and Workflows, with Application Testing and Debugging

Event Registration & Participant Management — Zoho Creator

1. Aim

To automate business processes in the Event Registration & Participant Management application using Zoho Creator workflows and Deluge scripting, and to test and debug the workflows to confirm that registration validation and email confirmation work correctly.

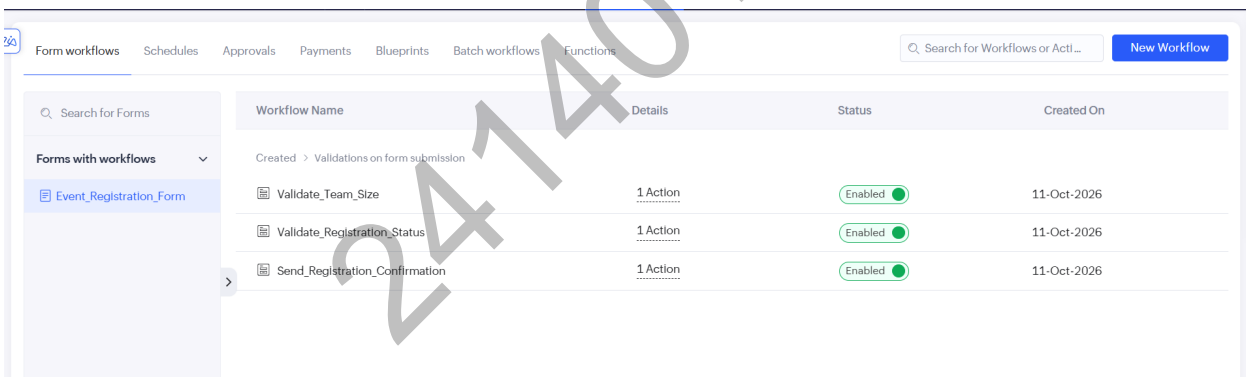

Objectives

1. Validate team size before a registration record is submitted.
2. Set the registration status to “Registered” automatically.
3. Send a confirmation email after successful form submission.
4. Test the form, stored report data, workflow execution, and email delivery.

2. Procedure

Step 1: Open the application and workflow settings

1. Open the Event Registration & Participant Management application in Zoho Creator.
2. Open the Workflows section and select **Event_Registration_Form**.
3. Create or review the form workflows and ensure each required workflow is enabled.

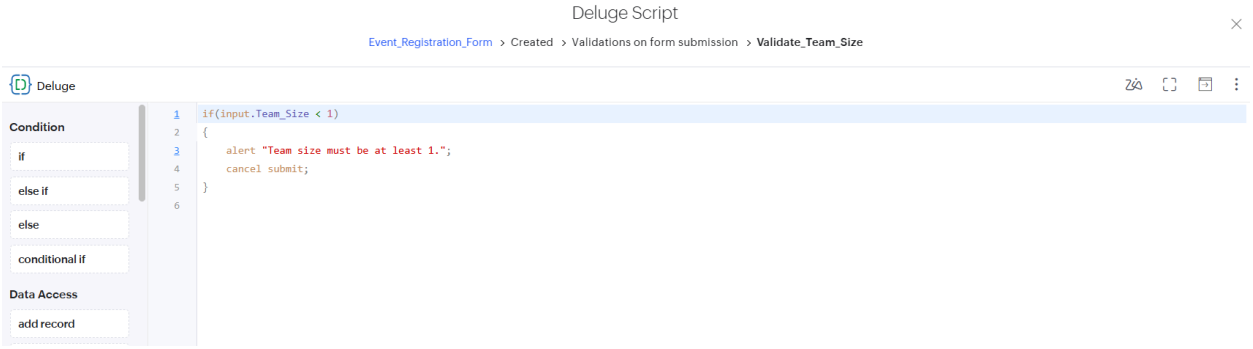

The workflow list shows the three enabled workflows: Validate_Team_Size, Validate_Registration_Status, and Send_Registration_Confirmation.

Step 2: Validate the team size

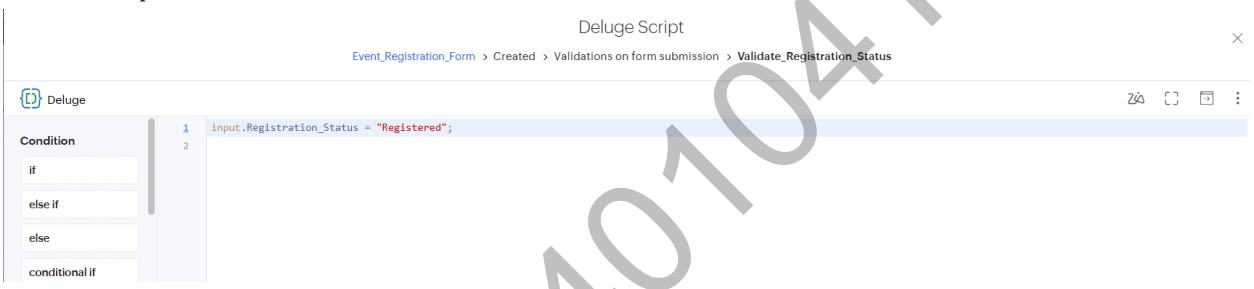

1. Open the **Validate_Team_Size** workflow under validations on form submission.
2. Add a Deluge condition to prevent a team size below 1.
3. Save the script and keep the workflow enabled.

Deluge script used for team-size validation. If the value is less than 1, an alert is displayed and submission is cancelled.

Step 3: Set the registration status

1. Open the **Validate_Registration_Status** workflow.
2. Set the Registration_Status field to “Registered” using Deluge.
3. Save the script and ensure the workflow is enabled.

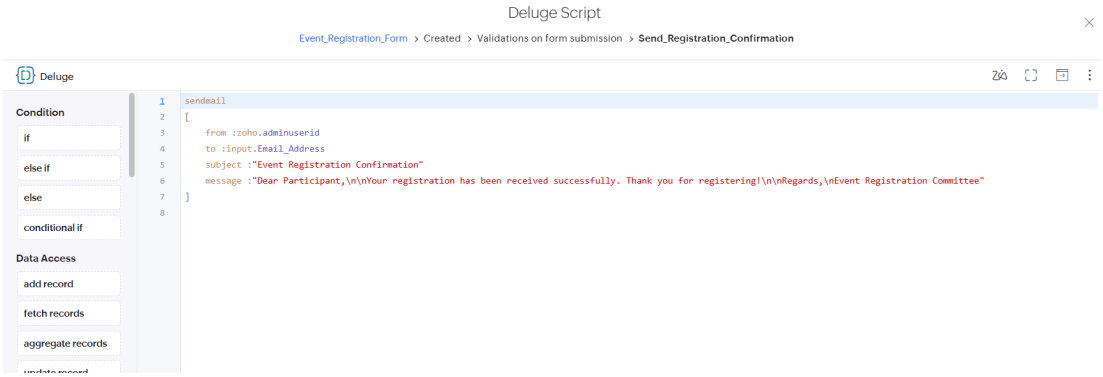

The script assigns the value “Registered” to input.Registration_Status.

Step 4: Configure the confirmation email

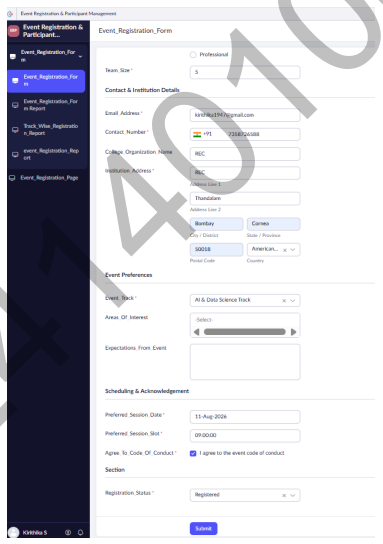

1. Open the **Send_Registration_Confirmation** workflow for the Created event.
2. Use the Deluge **sendmail** task with the verified Zoho Creator sender, the participant email field as recipient, and a confirmation subject and message.
3. Save the script and ensure the workflow is enabled.

The confirmation email script sends a message to the email address entered in the registration form.

Step 5: Test the application

1. Open the live **Event_Registration_Form**.
2. Enter valid test data, including a team size of at least 1 and an accessible email address.
3. Submit the form and check that the record appears in the application report.
4. Check the recipient inbox for the Event Registration Confirmation email.

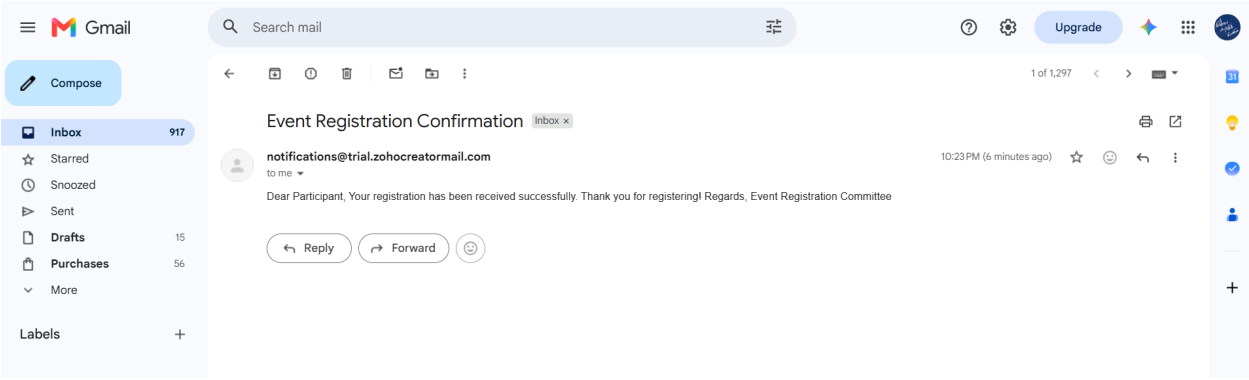

The live registration form used for end-to-end testing.

Step 6: Verify workflow execution and debug

1. Confirm that the form submission completes successfully and the registration is stored in the report.
2. Open the Workflows page and verify that all three workflows are enabled.
3. Open the recipient inbox and confirm that the Event Registration Confirmation email has arrived.
4. If the email does not arrive, check the sender configuration, verify the sender email, and review the Deluge script for syntax errors.

The confirmation email was received successfully in the inbox.

3. Output

Workflow configuration: Three workflows were created and enabled for the Event_Registration_Form: Validate_Team_Size, Validate_Registration_Status, and Send_Registration_Confirmation.

Validation: The team-size workflow checks that the entered team size is at least 1. The registration-status workflow assigns “Registered” to the status field.

Email automation: After successful registration, the confirmation workflow sends an email to the participant’s entered email address.

Testing and debugging: The form submitted successfully, the registration was stored in the report, and the confirmation email was received.

Result

The experiment was completed successfully. Deluge scripting and Zoho Creator workflows were used to validate registration data, set the registration status, and send an automated confirmation email. End-to-end testing confirmed that the form data was stored and the confirmation email was delivered.
