EXPERIMENT 11

Deploying a Zoho Creator Application from Development to Production Environment

Name: Kirithika S Roll No: 241401041

Aim

To demonstrate the process of adding a Zoho Creator application to Environments and reviewing its deployment stages, version information, and connected services.

Introduction

Zoho Creator Environments provides a structured space to manage an application through Development, Stage, and Production. Changes should be reviewed and tested before release to the live environment. The Environments page provides version information and controls such as Version History, Manage, and Publish.

Application Used

Event Registration & Participant Management — an application for managing event registrations and participant details.

Procedure

1. Open Zoho Creator and navigate to **Deploy** → **Environments**. Add the Event Registration & Participant Management application. Zoho Creator sends an email confirming that the application has been added and that creation in the development and stage environments is complete.

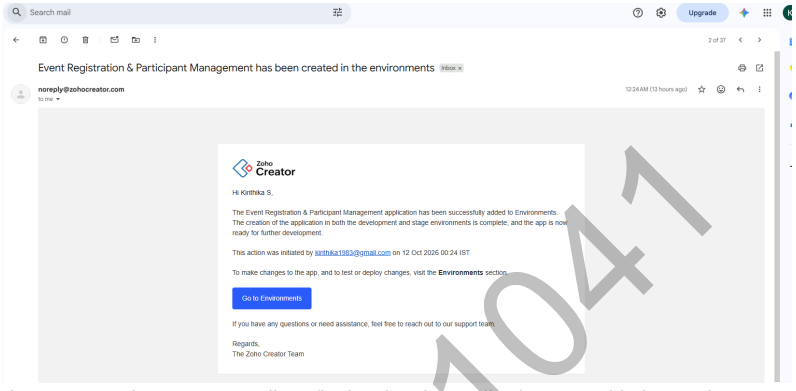

Figure 11.1: Zoho Creator email confirming that the application was added to Environments.

2. Return to the Environments page. The application appears with the status **No changes available**. Version **1.0** is displayed under both Stage and Production. This confirms the version listing, but does not by itself prove that a new version has been published or tested.

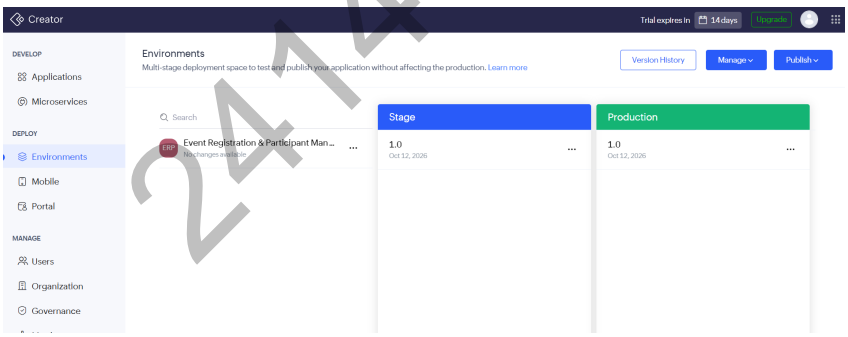

Figure 11.2: Event Registration application listed in Stage and Production, version 1.0.

3. Review the connected services. Under **Develop** → **Microservices** → **Connections**, the screenshot shows a Zoho Calendar Connection named **zoho_calendar_connection** with status **Connected**. It can be used by workflows that integrate with Zoho Calendar, subject to workflow configuration and permissions.

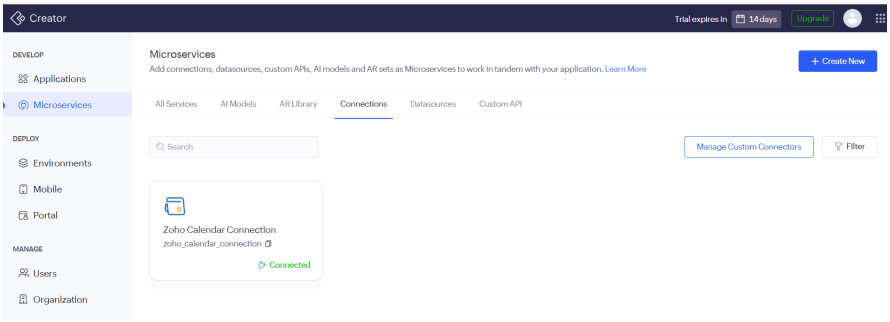

Figure 11.3: Zoho Calendar connection shown as Connected in Microservices.

Deployment Flow

Environment	Purpose	What to verify
Development	Build and configure the application.	Required forms, reports, workflows, and connections are configured.
Stage	Test the release candidate before production.	Test registration, validation, notifications, and connected services.
Production	Make the approved version available to end users.	Confirm the intended version and live status after publishing.

Result

The Event Registration & Participant Management application was added to Zoho Creator Environments, and version 1.0 was visible under Stage and Production. The Zoho Calendar connection was verified as Connected in Microservices. Before claiming a release is live, test the Stage version and confirm the final deployment status.
