EXPERIMENT 12

Implementing Security Features and Governance / Administration Practices in Zoho Creator

Name: Kirithika S **Register Number:** 241401041

Aim

To explore user permissions, role-based access and data-sharing settings in the Event Registration & Participant Management application using Zoho Creator.

Introduction

Security and governance features help control who can access an application, what actions they can perform, and which records they can view or modify. Zoho Creator provides permission profiles, a role hierarchy and data-sharing rules to support controlled collaboration. These settings should grant each user only the access needed for their responsibilities.

Application Used

Event Registration & Participant Management — an application used to manage event registrations and participant records.

1. User Permissions

In **Settings** → **Users** → **Permissions**, the application lists permission profiles and their descriptions. The supplied screen shows Organizer_Permission, Read, Registration_Staff_Permission and Write.

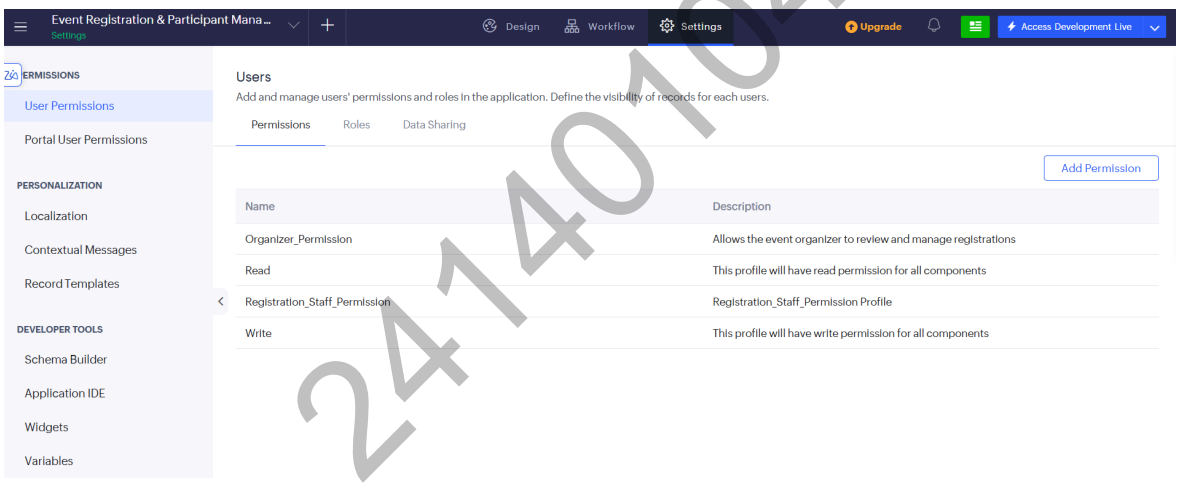

Figure 1: User Permissions available in the Event Registration application.

Permission	Purpose / description
Organizer_Permission	Allows the event organizer to review and manage registrations.
Read	Read permission for all components.
Registration_Staff_Permission	A permission profile for registration staff; the screen lists this profile.
Write	Write permission for all components.

241401041

2. Role-Based Access Control

The Roles tab displays the application's role hierarchy. In the supplied screenshot, CEO is at the top, Event_Organizer is below CEO, and Registration_Staff is below Event_Organizer. The page provides Expand All, Collapse All, Manage Role Hierarchy and Add Role controls.

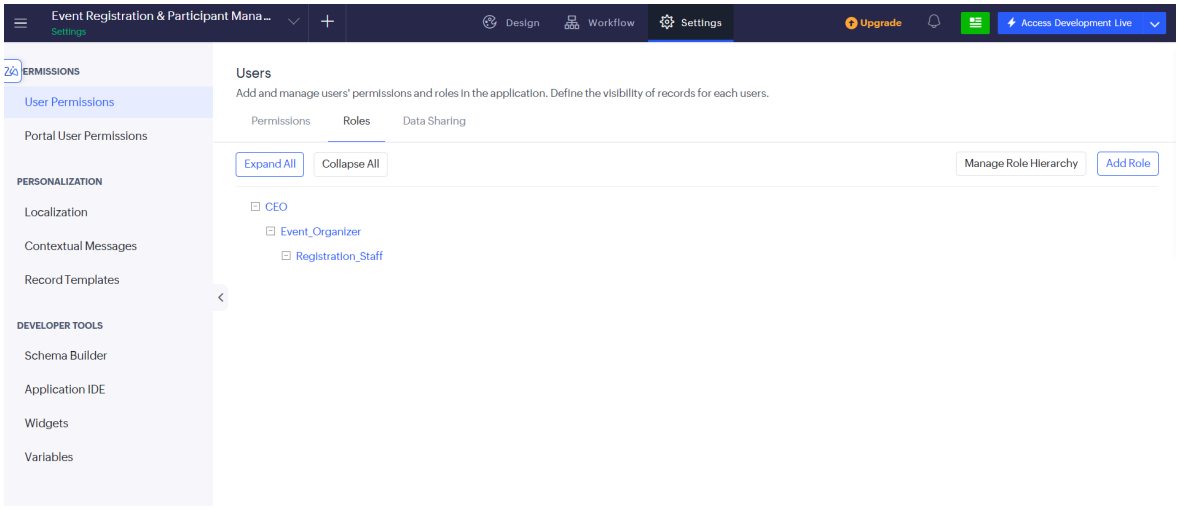

Figure 2: Roles and hierarchy configured in Zoho Creator.

Role	Position
CEO	Top level
Event_Organizer	Reports under CEO
Registration_Staff	Reports under Event_Organizer

A hierarchy provides an organizational structure for assigning responsibilities. The records visible to a user may also depend on the permission profile and the data-sharing rules configured for the application.

3. Configuring a Data-Sharing Rule

The New Share Rule panel is used to define which records are shared, from whom they are shared, the target role or user, and the level of access. The supplied screen shows a rule being configured with the following visible values:

241401041

3. Configuring a Data-Sharing Rule (continued)

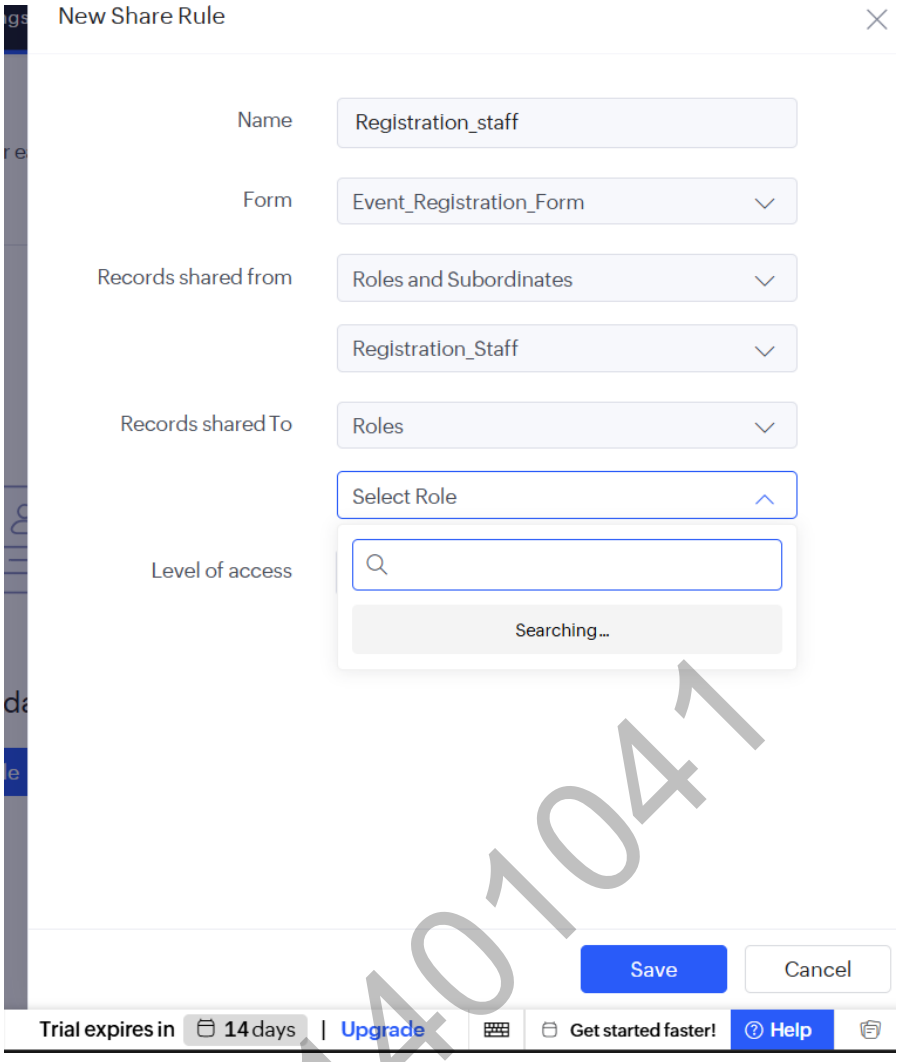

Figure 3: New Share Rule panel for registration staff.

Field	Value visible in screenshot
Name	Registration_staff
Form	Event_Registration_Form
Records shared from	Roles and Subordinates → Registration_Staff
Records shared to	Roles → role selection is open and still searching
Level of access	Not yet visible / not confirmed in the screenshot

The screenshot shows the role-selection dropdown still displaying “Searching…”. Therefore, the target role and final access level should not be treated as saved or completed yet. Select the intended role, choose the appropriate access level, and click Save only after verifying the rule details.

Result

The User Permissions and Roles settings of the Event Registration application were examined. The hierarchy CEO → Event_Organizer → Registration_Staff was identified, and the New Share Rule panel was opened with the visible rule details recorded. The target role and access level remain to be selected and saved.
