EXPERIMENT 10

Form Validation and Email Notification Using Deluge in Zoho Creator

Name: Kirithika S **Register Number:** 241401041
Subject: Low Code Application Development using Zoho Creator

Aim

To document an Event Registration form workflow that validates team size, assigns registration status, and sends a confirmation email after form submission.

Introduction

Zoho Creator workflows run actions configured for form events. Deluge scripts can validate input, update field values, and automate email notifications. This experiment documents the supplied workflow and its actual email output.

Application Details

Application: Event Registration & Participant Management **Form:** Event_Registration_Form
Workflow: Send_Registration_Confirmation

Objectives

• Validate that Team_Size is at least 1.
• Set Registration_Status to “Registered” when validation passes.
• Send a confirmation email to input.Email_Address.

Workflow Configuration

The workflow list screenshot shows four enabled workflows: Validate_Team_Size, Validate_Registration_Status, Send_Registration_Confirmation, and Sync_To_Zoho_Calendar. The script shown below documents the supplied validation, status assignment, and email notification logic.

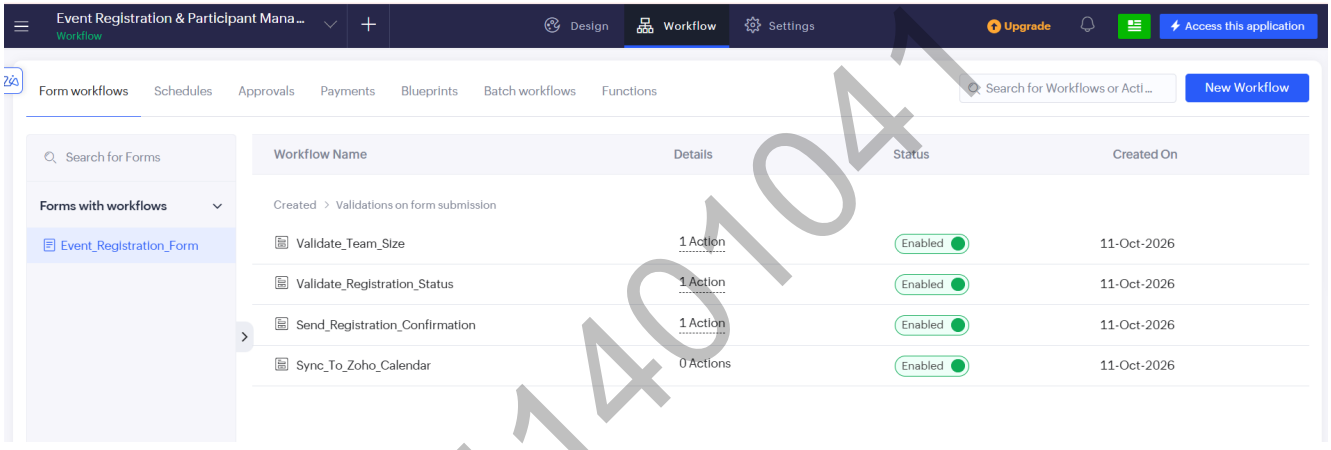

Figure 1. Enabled workflows configured for the Event Registration form.

Procedure and Deluge Script

1. Open the application in Edit mode and navigate to Workflow → Form workflows.
2. Select the registration confirmation workflow and inspect the Deluge script.
3. Submit a test registration and verify the confirmation email output.

```
if(input.Team_Size < 1)
{
    alert "Team size must be at least 1.";
    cancel submit;
}
input.Registration_Status = "Registered";
sendmail
[
    from :zoho.adminuserid
    to :input.Email_Address
    subject :"Event Registration Confirmation"
    message :"Dear Participant,\\n\\nYour registration has been received successfully. Thank you for registering!\\n\\nRegar
]
```

Code explanation

Code element	Function
input.Team_Size < 1	Checks whether the entered team size is below the minimum.
alert / cancel submit	Displays an alert and stops submission when the condition is true.
Registration_Status assignment	Sets the field value to Registered after validation passes.
sendmail block	Sends the confirmation email to input.Email_Address.

EXPERIMENT 10 — OUTPUT AND RESULT

Deluge Editor and Email Output

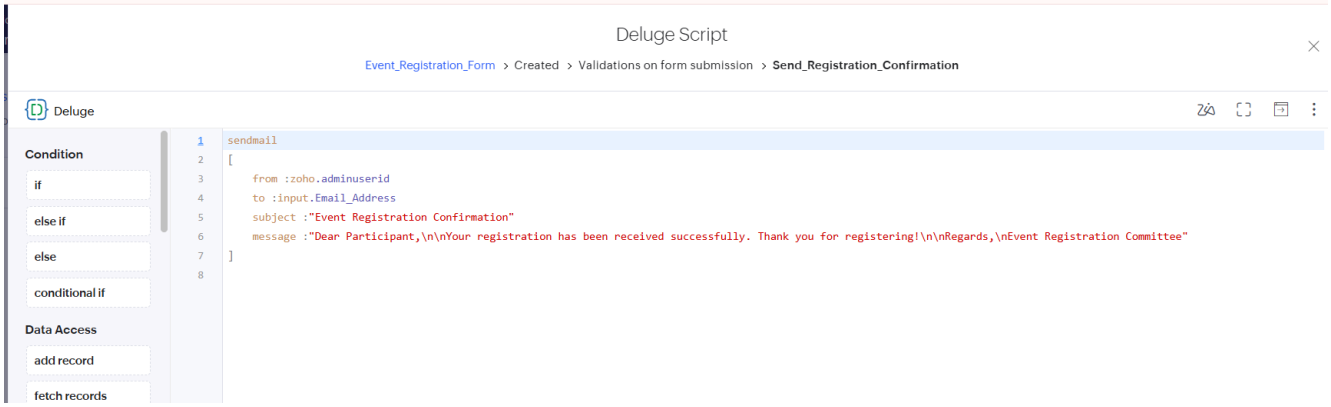

Figure 2. Deluge editor showing the supplied registration confirmation script.

Email Output

The supplied Gmail screenshot shows the Event Registration Confirmation email, providing evidence of the notification output.

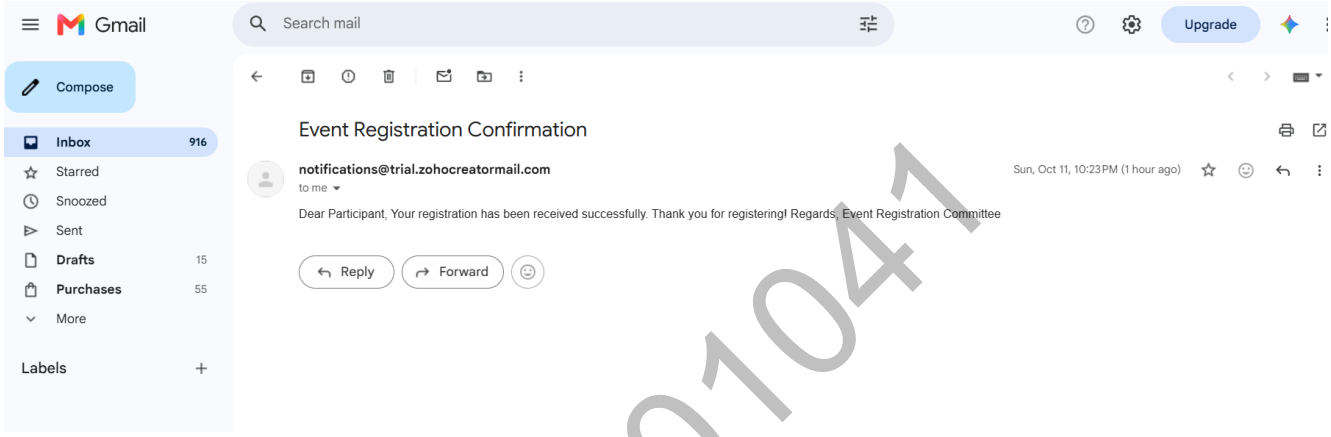

Figure 3. Received registration confirmation email.

Expected Behaviour and Observations

Condition/action	Expected behaviour	Evidence
Team_Size < 1	Alert shown and submission cancelled.	Defined in script.
Validation passes	Registration_Status set to Registered.	Defined in script.
Email action	Confirmation sent to the entered email address.	Gmail screenshot supplied.

Scope Note

The supplied script does not show record fetching or a separate blank-email check. This report therefore documents only the shown validation, status assignment, and email notification; it does not claim unshown performance improvements.

Workflow Flow

START — form submission
Check Team_Size
Team_Size < 1?
YES: alert and cancel submit | NO: set Registration_Status = Registered
Send email to input.Email_Address
END

Result

The Event Registration workflow was documented using the supplied Deluge script and screenshots. The script validates team size, assigns the registration status when validation passes, and sends a confirmation email. The workflow configuration, code, and email screenshot provide evidence of the documented process.
